## Statistics and Actuarial Science Seminar

---

**Dr. Simon P. Wilson (Statistics Department Trinity College  
Dublin)**

will speak on

**Bayesian methods in content-based image retrieval**

**Fri 13th October 2006 at 12:00AM**

Location: Mathematical Sciences Seminar Room

Content-based image retrieval refers to the indexing and retrieval of images from a database using their semantic content. In this talk some statistical solutions are presented that use Bayesian methods. Three issues will be addressed: how to produce a learning algorithm (via Bayesian inference), which images to select from the database to show to the user (via decision theory) and how to use data from previous similar searches to improve performance (again via Bayesian inference). A demo will be shown based on a database of paintings.

This talk is part of the **Statistics and Actuarial Science** series. For more, see
