# Pioneers of Scientific Forecasting

**Cleveland Abbe, Vilhelm Bjerknes, Lewis Fry Richardson**

# Cleveland Abbe

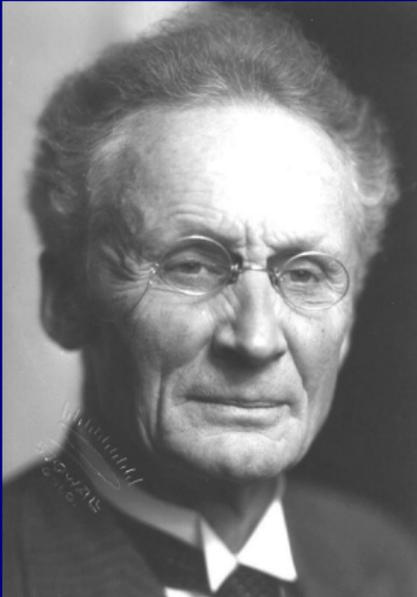

By 1890, the American meteorologist Cleveland Abbe had recognized that:

*Meteorology is essentially the application of hydrodynamics and thermodynamics to the atmosphere.*

Abbe proposed a mathematical approach to forecasting.

# Vilhelm Bjerknes

**A more explicit analysis of weather prediction was undertaken by the Norwegian scientist Vilhelm Bjerknes**

**He identified the two crucial components of a scientific forecasting system:**

- ▶ Analysis**
- ▶ Integration**

# Bjerknes' 1904 Manifesto

**To establish a science of meteorology, with the aim of predicting future states of the atmosphere.**

**“If it is true, as every scientist believes, that subsequent atmospheric states develop from the preceding ones according to physical law, then it is apparent that the necessary and sufficient conditions for the rational solution of forecasting problems are the following:**

# Vilhelm Bjerknes (1862–1951)

Forecast Factory: The Fantasy

# Lewis Fry Richardson

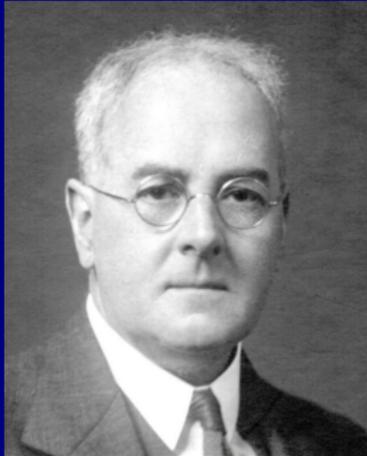

The English Quaker scientist Lewis Fry Richardson attempted a **direct solution of the equations of motion.**

He dreamed that numerical forecasting would become a reality **“one day in the distant future.”**

# Lewis Fry Richardson

The English Quaker scientist Lewis Fry Richardson attempted a **direct solution of the equations of motion.**

He dreamed that numerical forecasting would become a reality **“one day in the distant future.”**

**Today, forecasts are prepared routinely using his method ... his dream has indeed come true.**

# Richardson's Dream

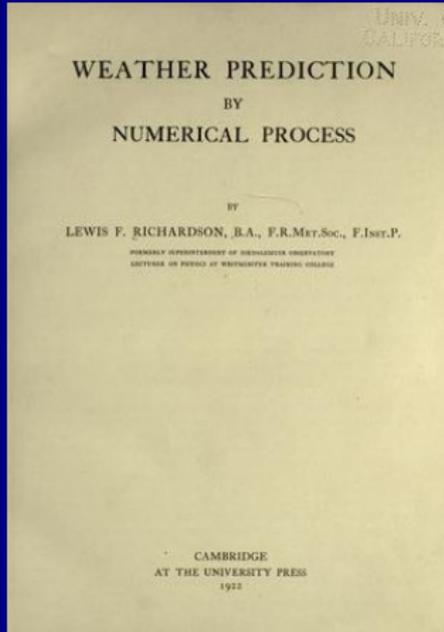

In *Weather Prediction by Numerical Process* (1922), Richardson wrote the following:

*Perhaps some day in the dim future it will be possible to advance the computations faster than the weather advances and at a cost less than the saving to mankind due to the information gained.*

*But that is a dream.*

# Weather Prediction by Numerical Process

**WPNP published by  
Cambridge University  
Press in 1922 ...**

**... just one hundred  
years ago!**

# *Weather Prediction by Numerical Process*

- ▶ **Mathematical method for predicting the weather.**
- ▶ **Richardson's ideas were fundamentally sound.**
- ▶ **His methodology is essentially that used today.**
- ▶ **But, his method was utterly impractical.**
- ▶ **His trial forecast was little short of outlandish.**

**Richardson's ideas were eclipsed for decades and his wonderful opus gathered dust and was forgotten.**

# The Origin of Richardson's Method

LFR first applied his approximate method for the solution of differential equations to investigate the stresses in **masonry dams**.

But the method was completely general and he realized that it had potential for use in a wide range of **problems governed by PDEs**.

In a letter to Karl Pearson (c. 1910), he wrote that **'there should be applications to meteorology'**. This is the first inkling of his interest in weather prediction.

LFR began serious work on the problem in 1913, when LFR was S'visor at **Eskdalemuir Observatory**.

# Eskdalemuir Office & Computing Room (1911)

# The Method described in WPNP

Initial state specified by pressure, temperature, density, humidity and wind fields.

Changes described by **seven differential equations**.

Atmosphere divided into discrete columns of extent  $3^\circ$  east-west and 200 km north-south.

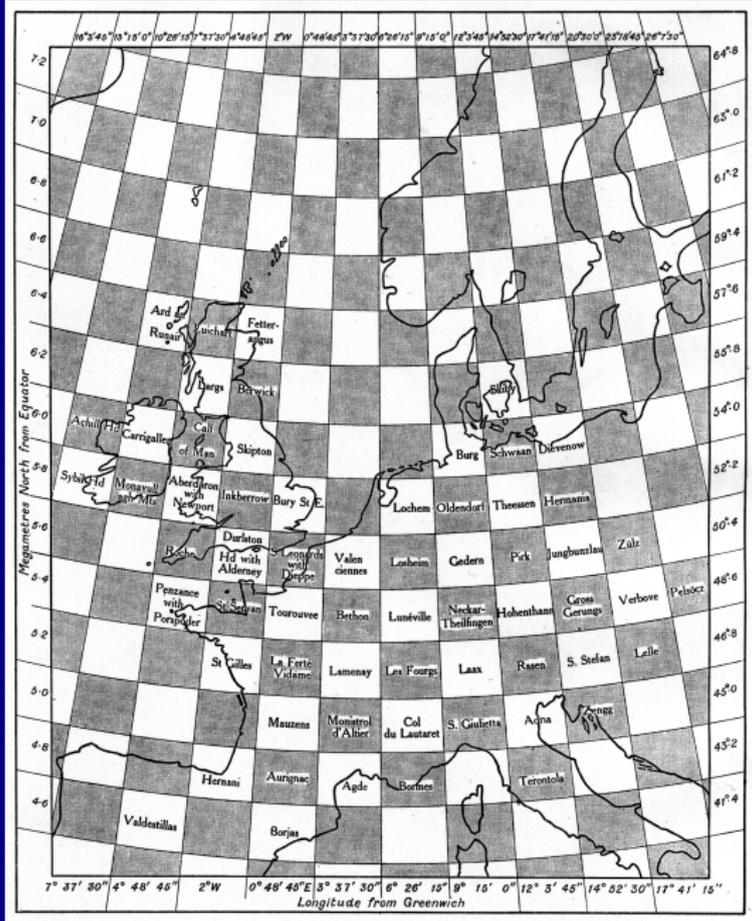

12,000 columns covered the globe.

Each column divided vertically into five cells.

Equations expressed in **finite difference form**.

Changes calculated by arithmetical means.

# The Sample Forecast

Forecast was worked out in France in rest periods between transporting wounded soldiers in WW I.

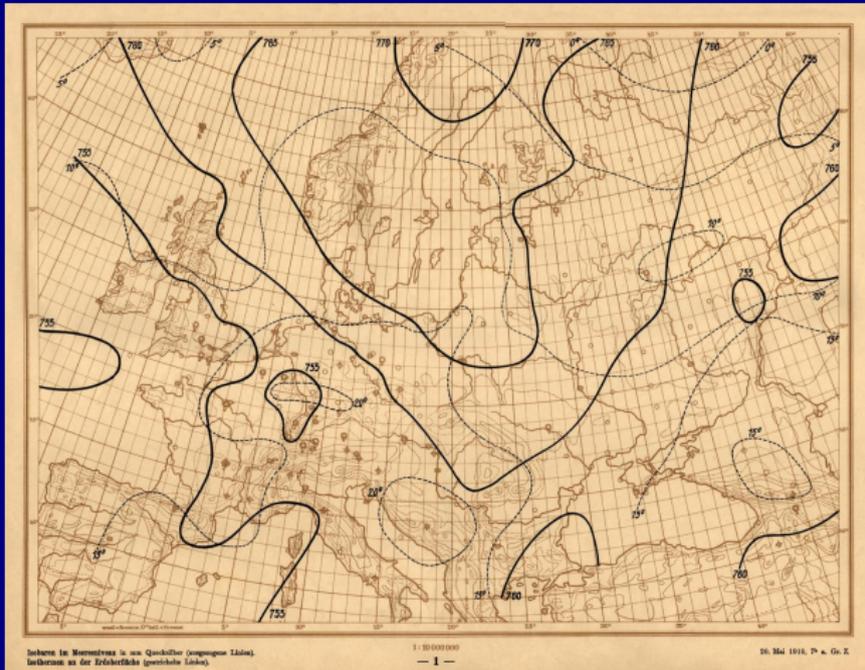

Richardson calculated the *initial changes in two columns* over central Europe.

The extent of his 'forecast': **20 numbers.**

If Richardson spent ten hours per week at his chore it must have occupied him for about two years.

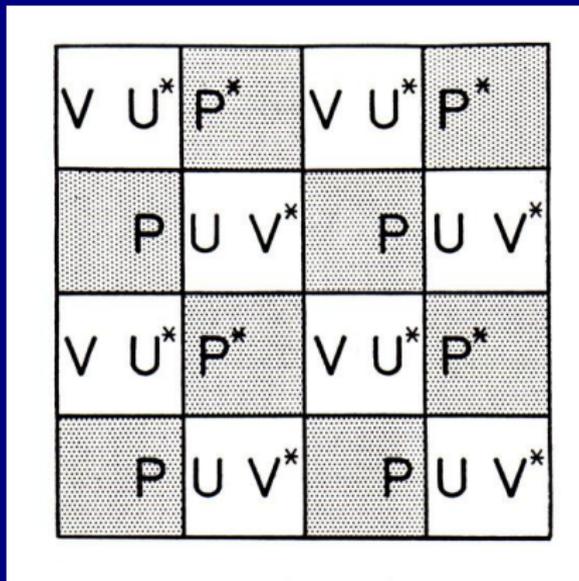

# The Leipzig Charts for 0700 UTC, May 20, 1910

**Bjerknes' sea level pressure analysis.**

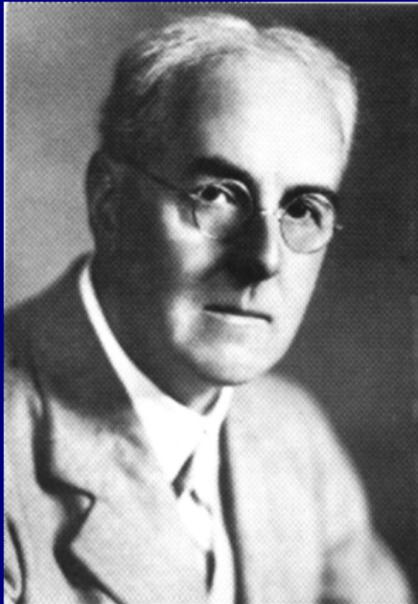

## Richardson Grid (also called an Arakawa E-grid)

# Lewis Fry Richardson, 1881–1953.

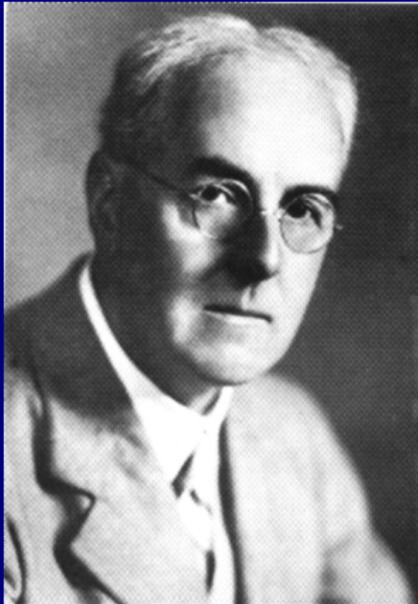

Richardson computed **by hand** the pressure change at a single point.

It took him **two years** !

# Lewis Fry Richardson, 1881–1953.

Richardson computed **by hand** the pressure change at a single point.

It took him **two years** !

His ‘forecast’ was a catastrophic failure:

$$\Delta p = 145 \text{ hPa in 6 hrs}$$

But Richardson’s **method** was scientifically sound.

# The problem

**Richardson used computed tendencies to deduce the long-term change.**

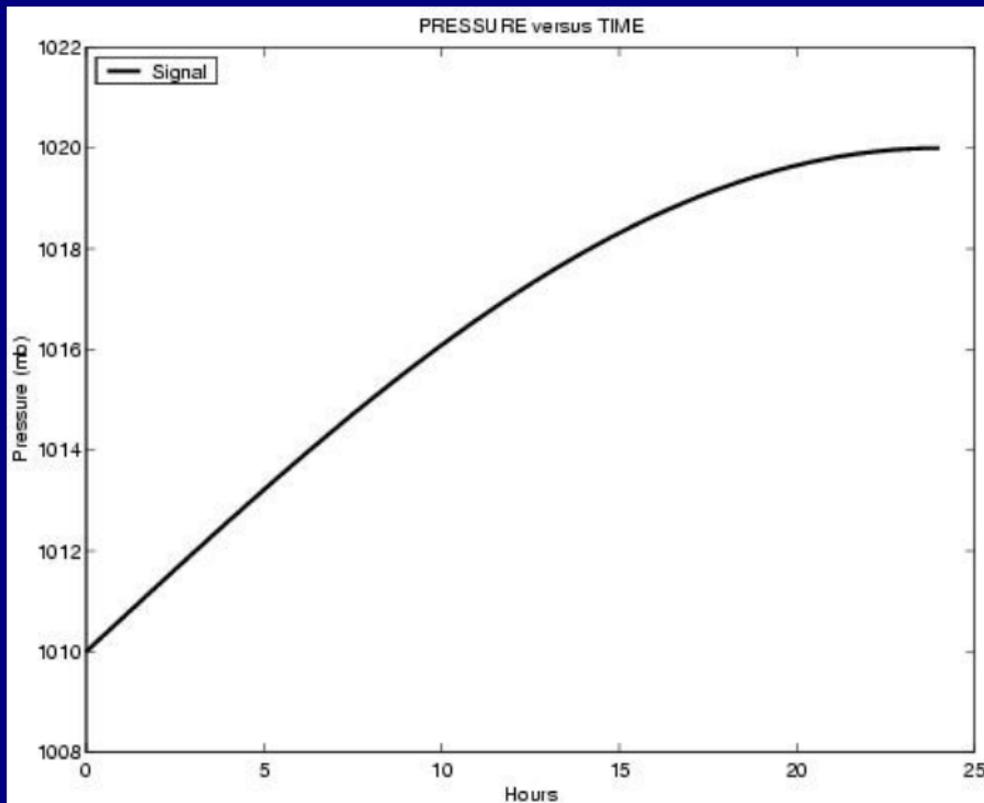

**With a time step of six hours, he obtained the unacceptable value**

$$\Delta p = 145 \text{ hPa in 6 hrs}$$

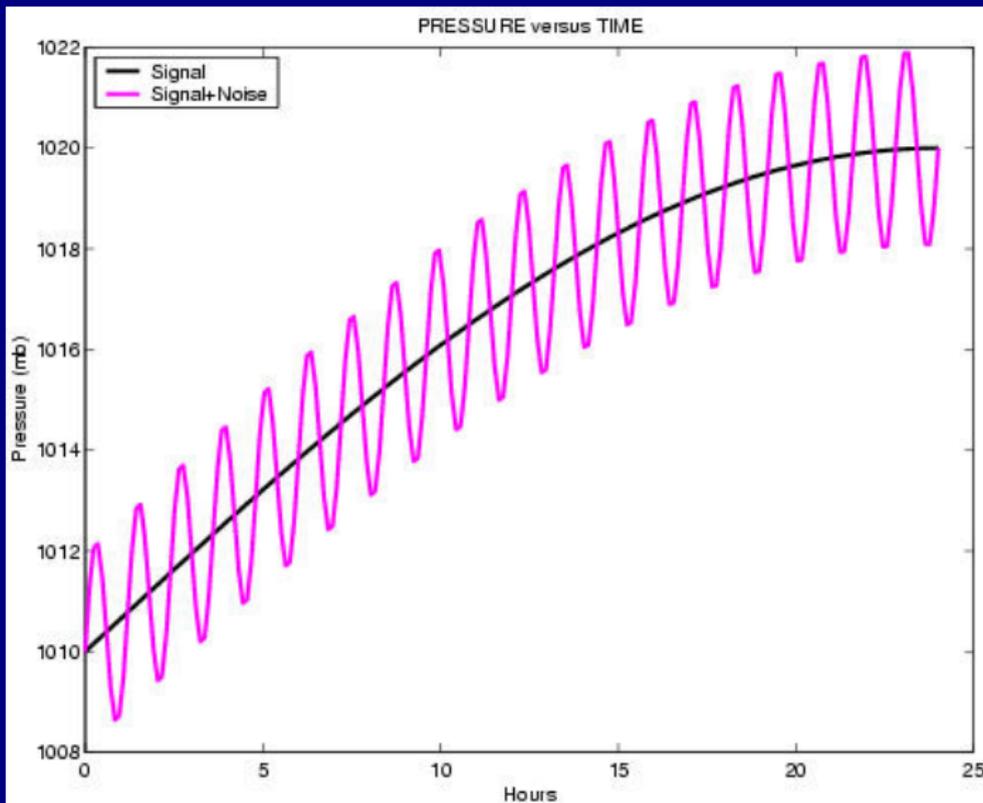

**Problem:  
the instantaneous pressure tendency  
does not reflect the long-term change.**

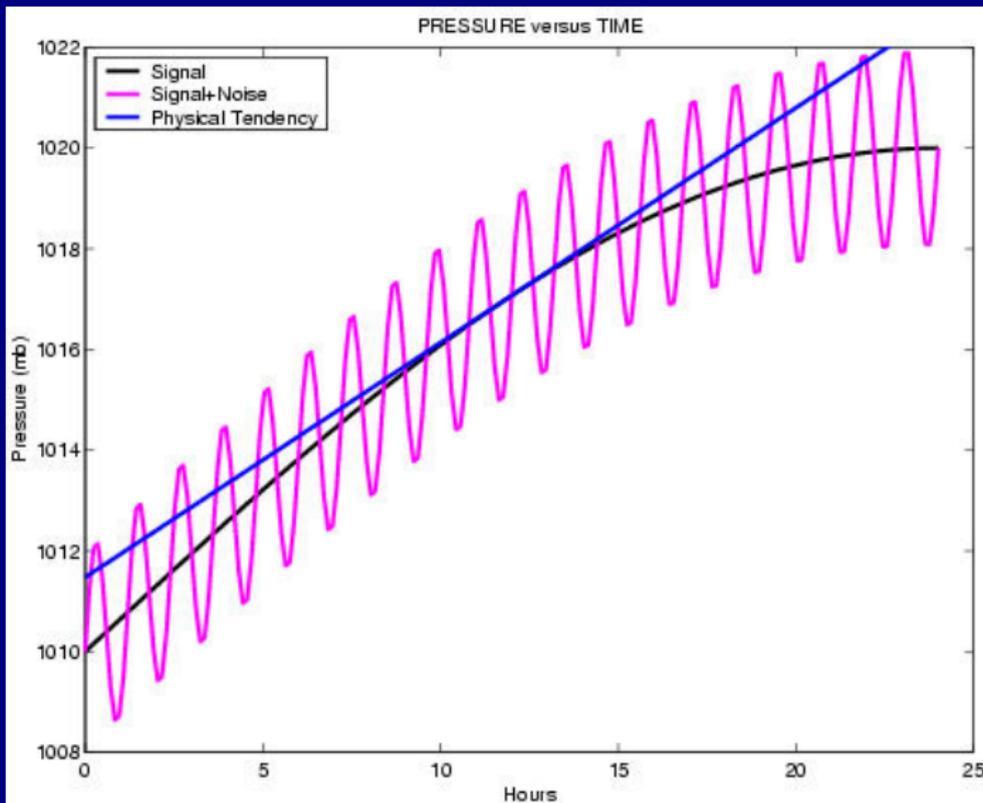

# A Smooth Signal

# Possible Solutions

**Small time steps are required to represent rapid variations:**

- ▶ **Combine many time steps short enough to simulate high frequency variations accurately.**

# Possible Solutions

**Small time steps are required to represent rapid variations:**

- ▶ **Combine many time steps short enough to simulate high frequency variations accurately.**

**Equations include high-frequency oscillations:**

- ▶ **Filter HF Solutions from the Equations.**

# Possible Solutions

**Small time steps are required to represent rapid variations:**

- ▶ **Combine many time steps short enough to simulate high frequency variations accurately.**

**Equations include high-frequency oscillations:**

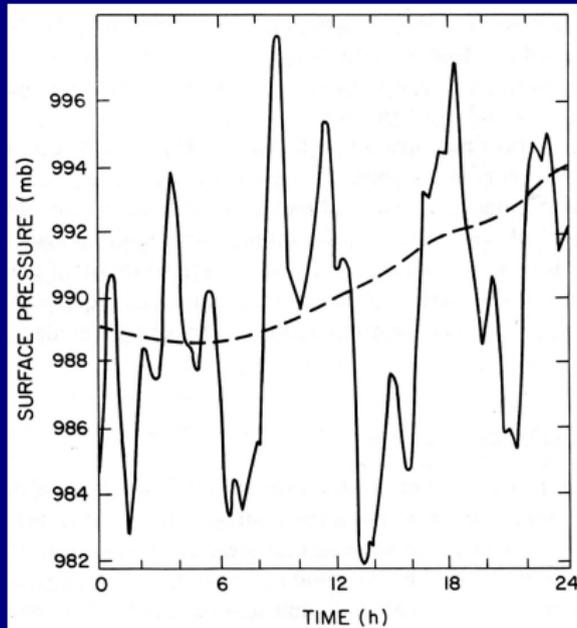

- ▶ **Filter HF Solutions from the Equations.**

**Data errors induce spurious HF components:**

- ▶ **Adjust the initial data to eliminate the HF waves.**

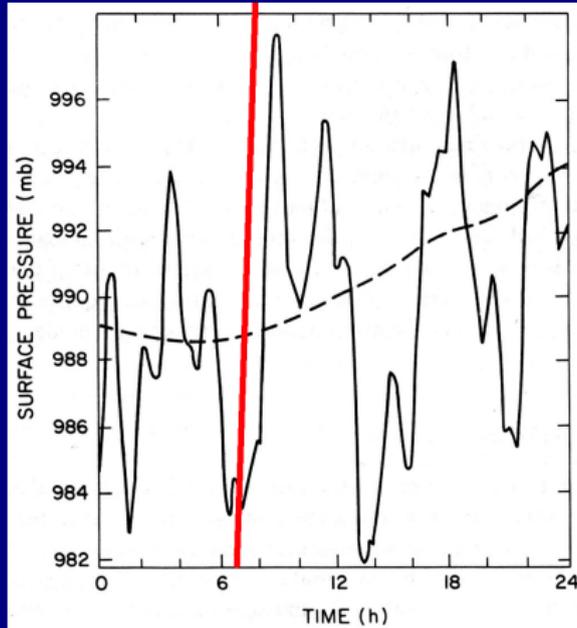

**Richardson devoted a chapter of WPNP to smoothing!**

**Evolution of surface pressure  
before and after initialization.**  
(Williamson and Temperton, 1981)

**Evolution of surface pressure  
before and after initialisation.**  
Red line: 24 hPa/hr or 144 hPa/6 hr.

# Initialization of Richardson's Forecast

Richardson's Forecast was repeated on a computer.

The atmospheric observations for 20 May, 1910,  
*were recovered from original sources.*

▶ **ORIGINAL:** 
$$\frac{\partial p_s}{\partial t} = +145 \text{ hPa}/6 \text{ h}$$

# Initialization of Richardson's Forecast

Richardson's Forecast was repeated on a computer.

The atmospheric observations for 20 May, 1910,  
*were recovered from original sources.*

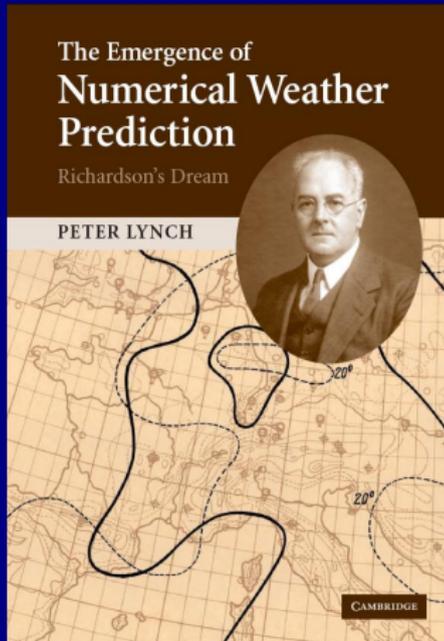

▶ **ORIGINAL:**  $\frac{\partial p_s}{\partial t} = +145 \text{ hPa}/6 \text{ h}$

▶ **INITIALIZED:**  $\frac{\partial p_s}{\partial t} = -0.9 \text{ hPa}/6 \text{ h}$

Observations: **The barometer was steady!**

# Full Account of the Forecast

**Richardson's Forecast  
and the  
Emergence of NWP  
are described in  
this book.**

# The Initial Response

Reviews were generally favourable:

- ▶ “A strikingly original scientific work”
- ▶ “One of the most remarkable books on meteorology ever written.”
- ▶ **Sydney Chapman**: “the enterprise contemplated in this book is of almost quixotic boldness”.
- ▶ **Edgar W. Woolard, U.S. Weather Bureau**: “It is to be hoped that the author will continue his excellent work along these lines . . . and that others will follow.”

# The Initial Response

However, not all reviews were so positive:

- ▶ **Napier Shaw:** “the wildest guess at the pressure change would not have been wider of the mark.”
- ▶ **Alexander McAdie, Harvard:** The book “will probably be quickly placed on a library shelf . . . to rest undisturbed.”

# Whipple's Review

**A perceptive review by F. J. W. Whipple, Met Office came closest to explaining Richardson's unrealistic forecast, postulating that rapidly-travelling waves contributed to its failure.**

**“The trouble that he meets is that quite small discrepancies in the estimate of the strengths of the winds may lead to comparatively large errors in the computed changes of pressure.”**

**Whipple appears to have had a clear understanding of the causes of Richardson's forecast catastrophe.**

# Aftermath

**Richardson's work was not taken seriously**

**His book failed to have any significant impact on the practice of meteorology for decades**

# Aftermath

**Richardson's work was not taken seriously**

**His book failed to have any significant impact on the practice of meteorology for decades**

**But finally ...**

**... Richardson's brilliant and prescient ideas are now universally recognised and his work is the foundation upon which modern forecasting is built.**

# Met Office Website

Forecast Factory: The Fantasy

# 1904: A Fateful Year

The year 1904 was pivotal for NWP:

- ▶ **Vilhelm Bjerknes**' announced his program for rational weather forecasting.
- ▶ **Felix Exner** attempted an actual calculation of the atmospheric changes.
- ▶ **Max Margules** demonstrated that weather prediction was fraught with danger.

# Max Margules (1856–1920)

In 1904, Margules published a paper in the *Festschrift* marking the sixtieth birthday of his former teacher, the renowned physicist Ludwig Boltzmann:

***Über die Beziehung zwischen Barometerschwankungen und Kontinuitätsgleichung.***

# Margules' Approach

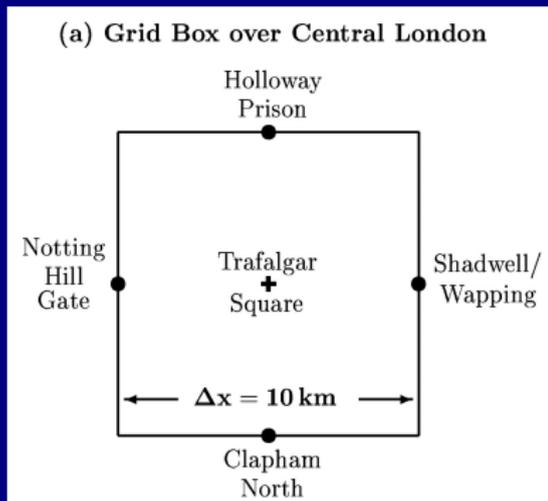

- ▶ Margules considered the possibility of predicting pressure changes using the continuity equation.
- ▶ He showed that, to obtain an accurate estimate of the pressure tendency, the winds would have to be known to an impractically high accuracy.
- ▶ So forecasting synoptic changes by this means was doomed to failure.

## Margules conclusion:

Weather forecasting is *"immoral and damaging to the character of a meteorologist"* (Quote: Fortak, 2001).

# Tendency from Continuity Equation

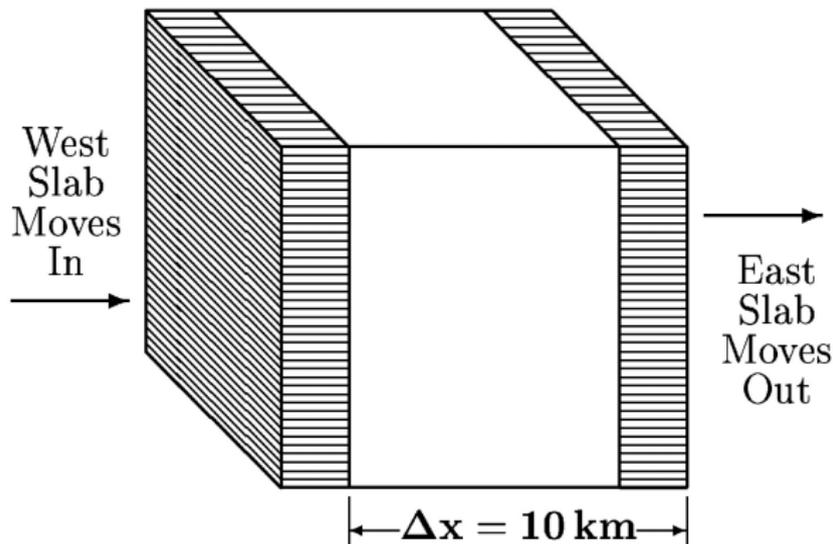

- ▶ Square of side 10 km over Central London.
- ▶ Like a cell of an atmospheric model.

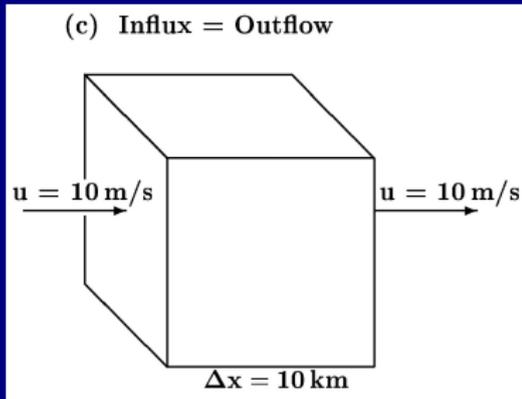

# “What Flows In Must Flow Out?”

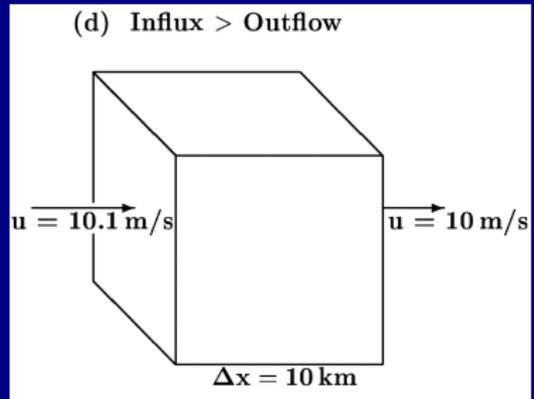

(b) Influx and Outflow

# A Box of Air over London

**Influx equals Outflow:  
Pressure unchanged.**

**Influx exceeds Outflow:  
Pressure will rise.**

# Pressure Tendency

Assume a westerly wind over London

$$u > 0, \quad v = 0.$$

Assume the surface pressure is initially 1000 hPa.

Using Conservation of Mass, a simple calculation yields the following **amazing result**:

- ▶ If the speed on the western side *exceeds* that on the east by 0.1 m/s, then  $\partial p_s / \partial t \approx 1 \text{ Pa/s}$ .
- ▶ If this influx continues, **the pressure will double in a day.**

# Pressure Tendency

Assume a westerly wind over London

$$u > 0, \quad v = 0.$$

Assume the surface pressure is initially 1000 hPa.

Using Conservation of Mass, a simple calculation yields the following **amazing result**:

- ▶ If the speed on the western side *exceeds* that on the east by 0.1 m/s, then  $\partial p_s / \partial t \approx 1 \text{ Pa/s}$ .
- ▶ If this influx continues, **the pressure will double in a day.**

**We must use the continuity equation with great care!**

# Richardson and Margules

**Margules sent a copy of his 1904 paper to the Met Office. His results showed that LFR's approach was doomed from the outset.**

**Richardson ascribed the difficulties with his predicted tendency to spurious divergence values.**

**It seems that Richardson was unaware of Margules' paper. He makes no reference to it.**

**Had Richardson been aware Margules' results, he might have decided not to proceed with his forecast.**

**Later, LFR proposed using the vertical component of vorticity as a primary variable.**

# Weather and Climate Models

Computer models for simulating weather and climate are known as **Earth System Models**.

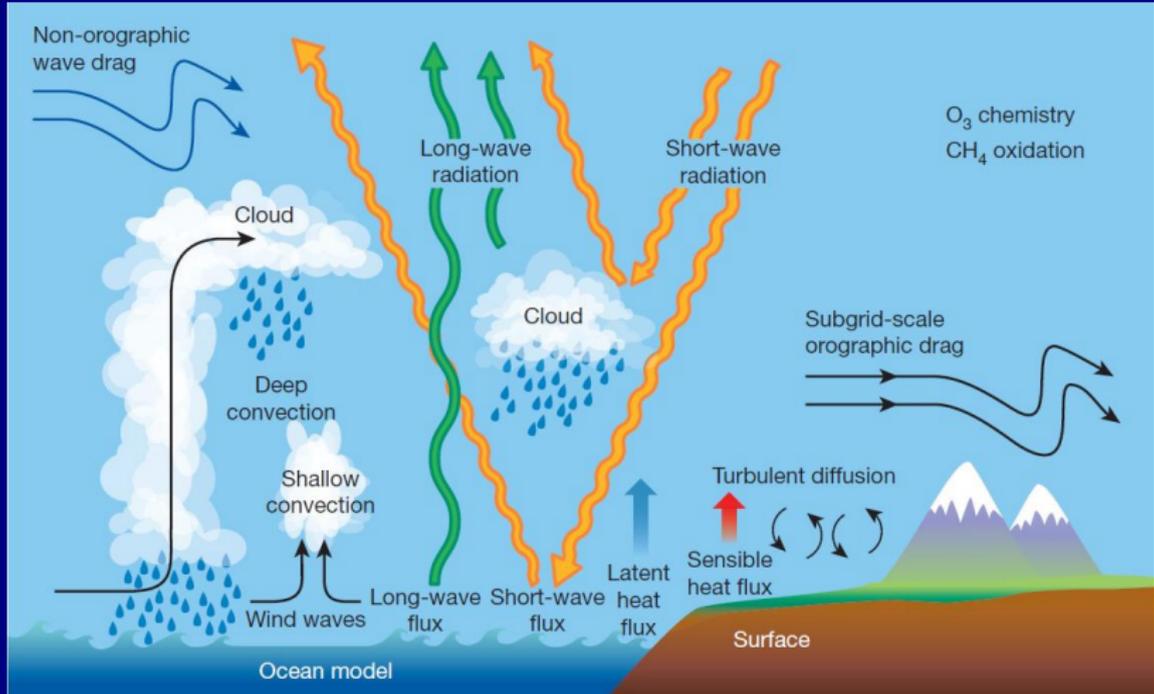

They are of great complexity.

At the heart of every model is a **Dynamical Core**.

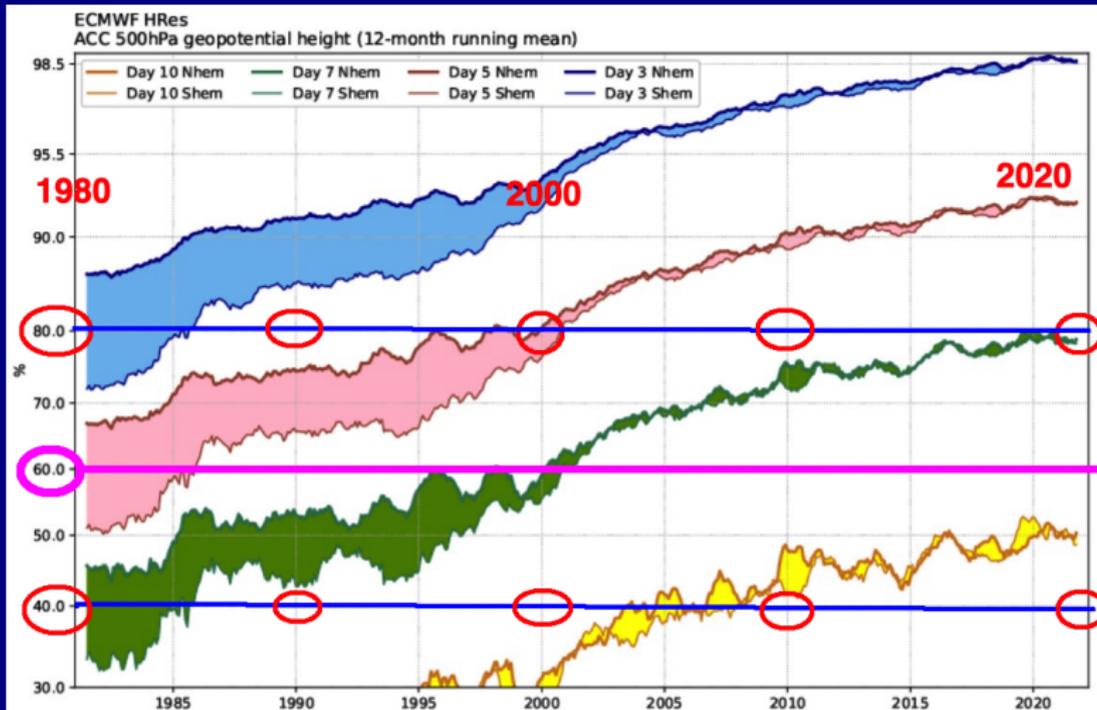

At the kernel of the core lie the **Navier-Stokes Equations**.

# Physical Processes in the Atmosphere

# Forecast Skill: Onward and Upward

## ECMWF Forecast Skill over 40 Years

# Reasons for Progress in Weather Forecasting

- ▶ **Faster computers;**
- ▶ **Better numerical schemes;**
- ▶ **Enhancements in model resolution;**
- ▶ **New observational data from satellites;**
- ▶ **More comprehensive physical processes;**
- ▶ **Paradigm shift to probabilistic forecasting;**
- ▶ **More sophisticated methods of data assimilation.**
